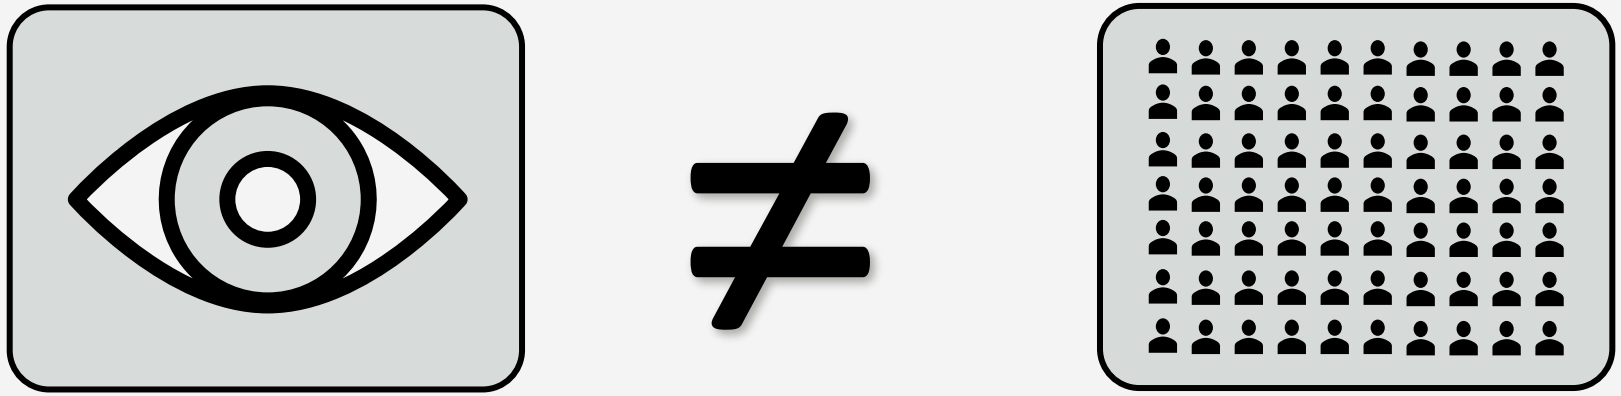
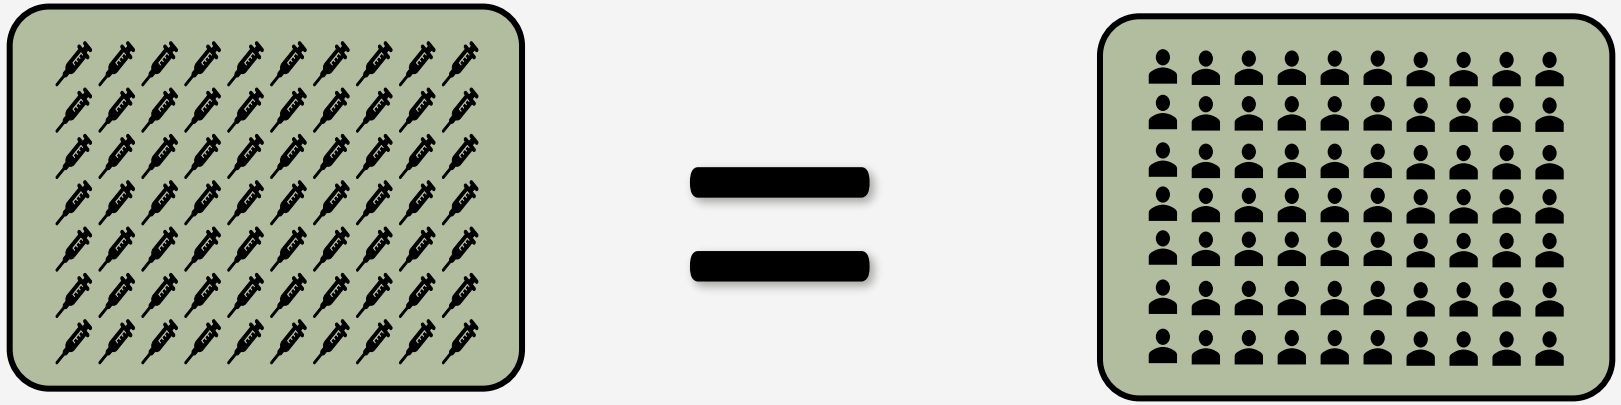
PUGET SOUND THERAPEUTICS

© 2026 Puget Sound Therapeutics, Inc. Proprietary. Not for redistribution.

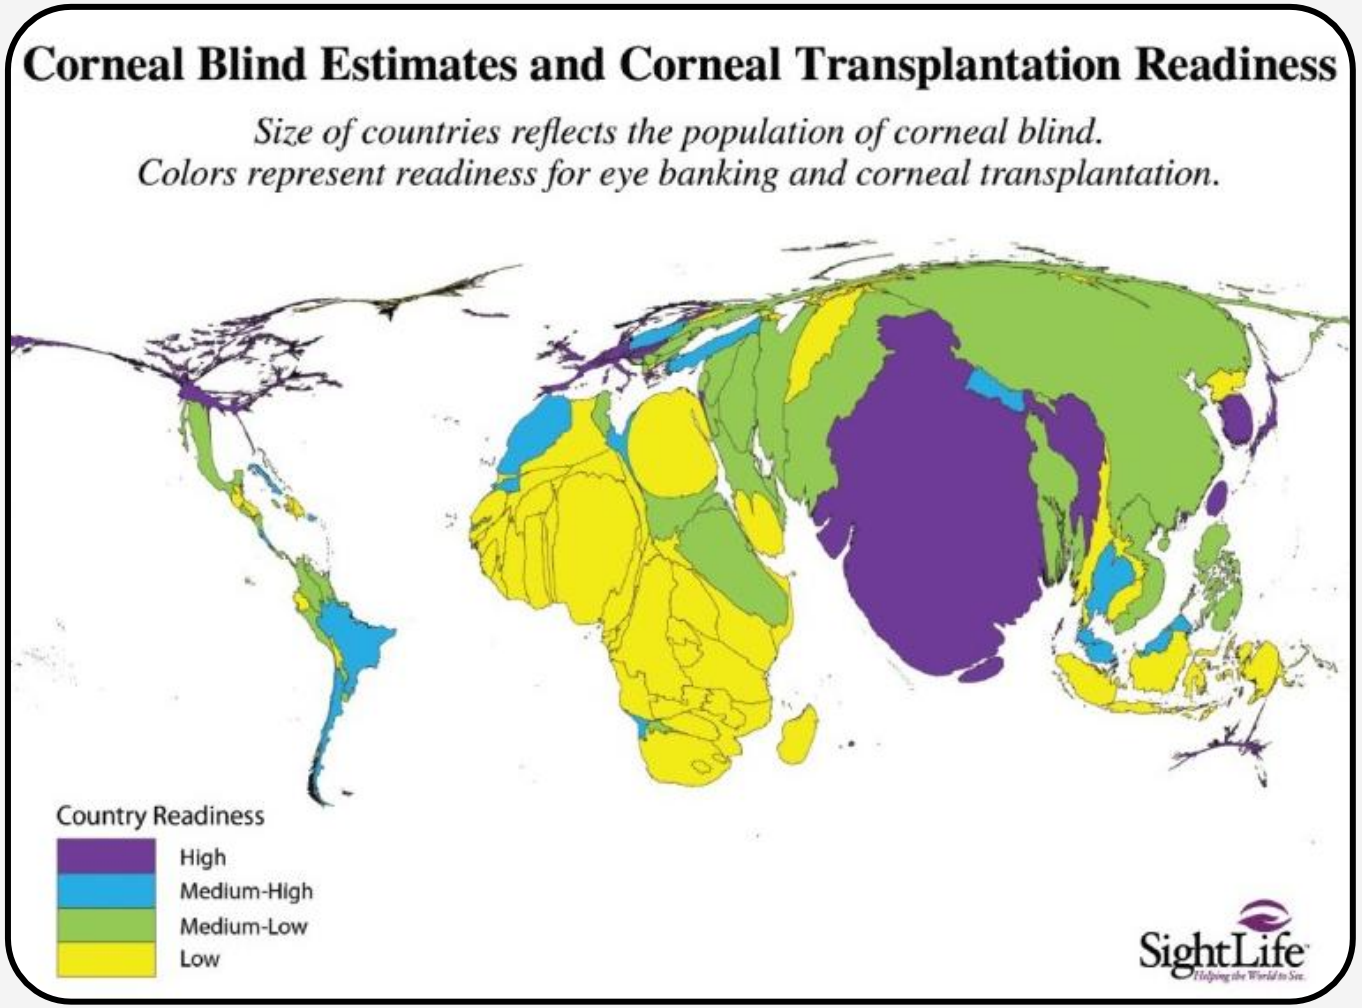
Currently, only 1 cornea is available for every 70 people in need of a cornea transplant.





Puget Sound Therapeutics (PST) will eliminate corneal endothelial disease through the development of a globally scalable, curative corneal endothelial cell (CEC) therapy.

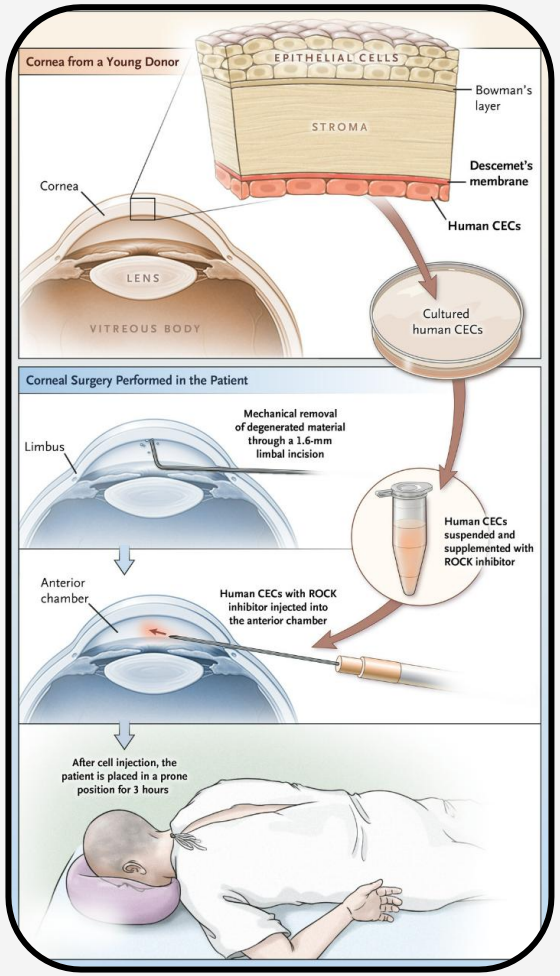
More than 13 million people around the globe suffer from curable corneal blindness due to the limited availability of corneal transplant tissues.



- **>50% of the global population has no access to cornea transplants.**
- **In countries like Canada, the wait time for a transplant is often 6 months to 3 years.**
- **4% of the global population age 40+ have some form of corneal endothelial disease.**

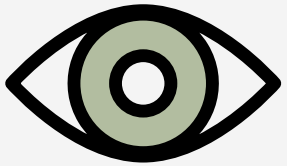
Corneal endothelial cell therapy is a clinically validated class of technology that offers a solution the global shortage of transplantable corneal tissue.

- Since 2013, corneal endothelial cell therapies have been successfully used in investigational contexts to treat corneal endothelial disease.
- CECs are immuno-privileged and can be transplanted between any donor and recipient without risk of rejection or need for immunosuppression.
- >1000 curative cell therapy doses can be produced from a single donated cornea.
- Injection of the cell therapy is faster, less invasive, and less complicated than corneal transplant procedures.



(Kinoshita et al., 2018)

1 Donor



1000 Doses

X 1000

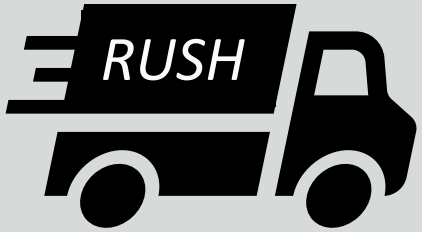
1st generation therapies use unpreserved cells, are unreliable in production and distribution, and cost 10X more than traditional transplants.

(2029 – Earliest Projected Competitor US Commercial Availability)

Manual Manufacturing

- ↓ Low Throughput Methods
- ↓ **High Lot Failure** Rates
- ↓ Operator Dependent Quality

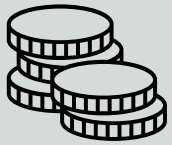
+



Fresh Cell Distribution

- ↓ **24-96** Hour Shelf Life
- ↓ High Pressure Logistics
- ↓ Regional Manufacturing

=



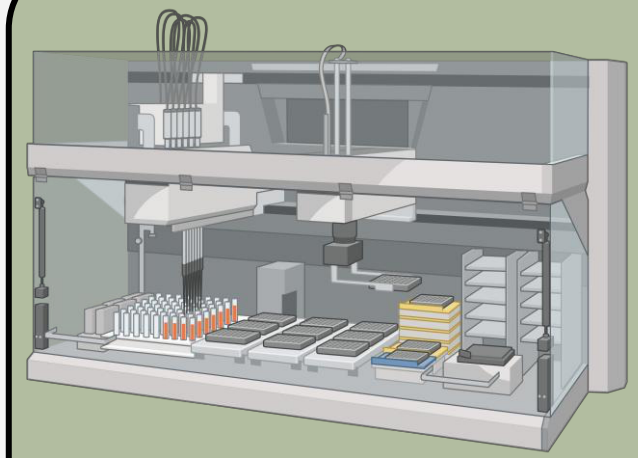
Prohibitively Expensive

Unreliable Quality

Unscalable Product

- ↓ High Cost (**$60K+** Per Dose)
- ↓ Unreliable Quality
- ↓ Unable to Scale Up

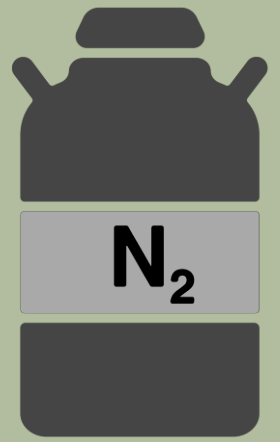
PST has developed a cryopreserved cell therapy that solves the problems of scalability, distribution, and is produced for 1/10th the cost of 1st gen products.



Semi-Automated Manufacturing

- ↑ **Highly Scalable** Processes
- ↑ Low Operator Dependency
- ↑ Consistent Culture Quality

+



Cryopreserved Cell Distribution

- ↑ **2+ Year** Shelf Life
- ↑ Standard Distribution
- ↑ Global Manufacturing

=

Global Patient Access

Globally Scalable Product

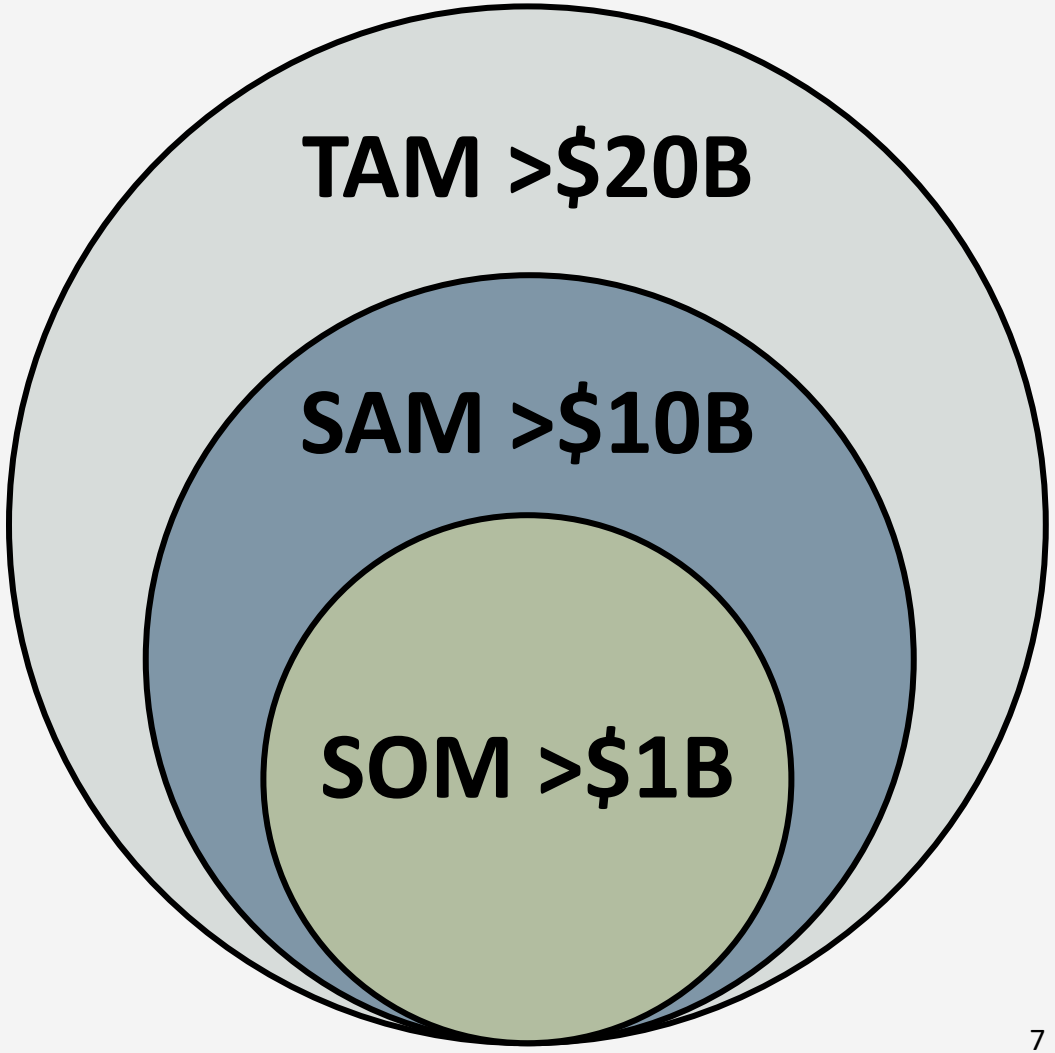
- ↑ COGM **<$500** Per Dose
- ↑ Consistent Product Quality
- ↑ Global Scale & Distribution

PST's cryopreserved corneal endothelial cell therapy comprehensively addresses a multi-billion-dollar global market opportunity.

<u>SOM</u> – Replacement of DMEK/DSEK transplants as standard of care in developed markets.
*(>100,000 patients/year * $10,000/patient)*

<u>SAM</u> – Treatment of all diagnosed endothelial disease in developed markets and replacement of DMEK/DSEK as standard of care in all global markets.
*(>1M patients/year * $10,000/patient)*

<u>TAM</u> – Treatment of global population with endothelial disease + use as concomitant therapy in developed markets to enable surgical interventions in patients with high endothelial risk + use of cryopreservation IP in adjacent cell therapy indications.



PST closed an oversubscribed pre-seed round of funding in June 2025. All pre-seed objectives have been achieved ahead of schedule.

1. Develop Cell Culture & Propagation Process

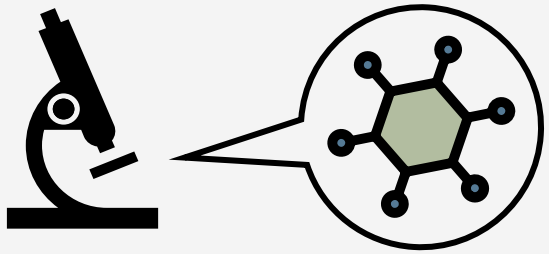
- ✓ Demonstrate ability to propagate endothelial cells in culture with high density, hexagonality, and phenotypic conformity
- ✓ Demonstrate ability to expand endothelial cell volumes through serial passages

2. Develop Cryopreservation & Reanimation Process

- ✓ Demonstrate ability to harvest cultured cells, cryopreserve the cells, and reanimate the cells with high cell viability
- ✓ Demonstrate ability for reanimated cells to establish dense, highly hexagonal, and phenotypically mature endothelial cell cultures

3. Identify Proprietary Biomarkers

- ✓ Characterize cell states that enable cryopreservation and viable reanimation of endothelial cells
- ✓ Identify biomarkers associated with cryopreservable cell states that can be used for novel intellectual property filings



PST's major pre-seed investors represent deep experience in ophthalmology and biotechnology.

ROBERT WARNER

Former President & GM of Alcon Vision Care
Experienced board member and advisor

MIKE RICE

Former CEO – BioLife Solutions
Biotech board member & advisor
Cryopreservation industry leader

DR. VANCE THOMPSON

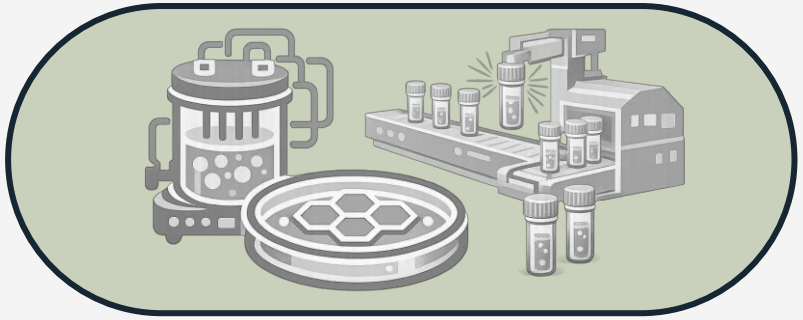
MONTY MONTOYA

Founder – CorneaGen & Aurion Biotech
Cornea & ophthalmic industry leader
Experienced biotechnology CEO, board member, and advisor

PST is now raising a $5M Seed round of funding to enable execution of its first-in-human clinical trial by early 2027.

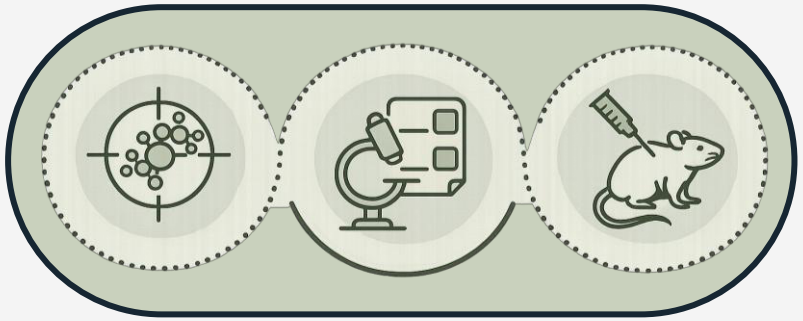
1. Activate GMP Manufacturing

- Execute Technology Transfer
- Complete Engineering Runs
- Produce Clinical Trial Material



2. Complete Non-Clinical Development Packages

- Toxicology Study
- Biodistribution Study
- In-Vivo (Animal) Efficacy Modeling



3. Execute 30 Patient Phase 1 Trial

- Trial will occur outside of the US (Latin America)
- 3-Month Primary Endpoint
- 12-Month Safety & Efficacy Follow Up

Confidential

1st gen competitor, Aurion Biotech, was acquired for >$1B in March 2025 after topline readout of its Phase 1/2 clinical trial. PST anticipates similar exit opportunities.

Anticipated Exit Window

	OUS Phase 1	US Phase 1/2	US Phase 3
PST Milestone Target Completion Date	Q2 2027	Q1 2029	Q3 2031
Cumulative Investment Required	$5.5M	$40M	$140M
Average Cell Therapy Company Valuation	$109M	$734M	$1.6B

- Aurion Biotech was acquired by ophthalmology strategic, Alcon, for a valuation >$1B in March 2025 following topline readout of their combined Phase 1/2 clinical trial.
- PST will follow precedent set by 1st gen developers to accelerate US clinical development, combining the US Phase 1 and Phase 2 clinical trial.
- PST is actively engaging with industry strategics and anticipates opportunities for acquisition following completion of a combined US Phase 1/2 clinical trial.

Puget Sound Therapeutics is a member of globally recognized, premier life sciences incubator programs.

Johnson&Johnson

Puget Sound Therapeutics is a virtual company of Johnson & Johnson Innovation - JLABS, a premier life science incubator program. JLABS is a global network of open innovation ecosystems, enabling and empowering innovators to create and accelerate the delivery of life-enhancing health and wellness solutions to patients around the world. As a leader in innovation, JLABS helps entrepreneurs in pharmaceutical, medical device, consumer, and health tech bring healthcare solutions to patients and consumers.
